A robot is a device that contains many automations

Each automation consists of three parts:

1) Input: the information inserted to the system through a sensor (a device that records any change in the environment) **CAUSE**

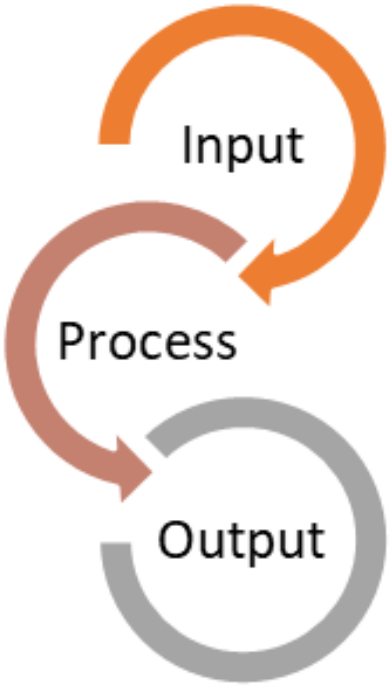

2) Process: the reasoning process that uses the information from the input to come to a reaction

3) Output: running of the reaction **RESULT**

Can you think of any similarity between this and the way humans react to stimuli?

Airplanes always fly in the atmosphere, correct?

Yeah!

Could we see how the atmospheric air affects an airplane's motion?

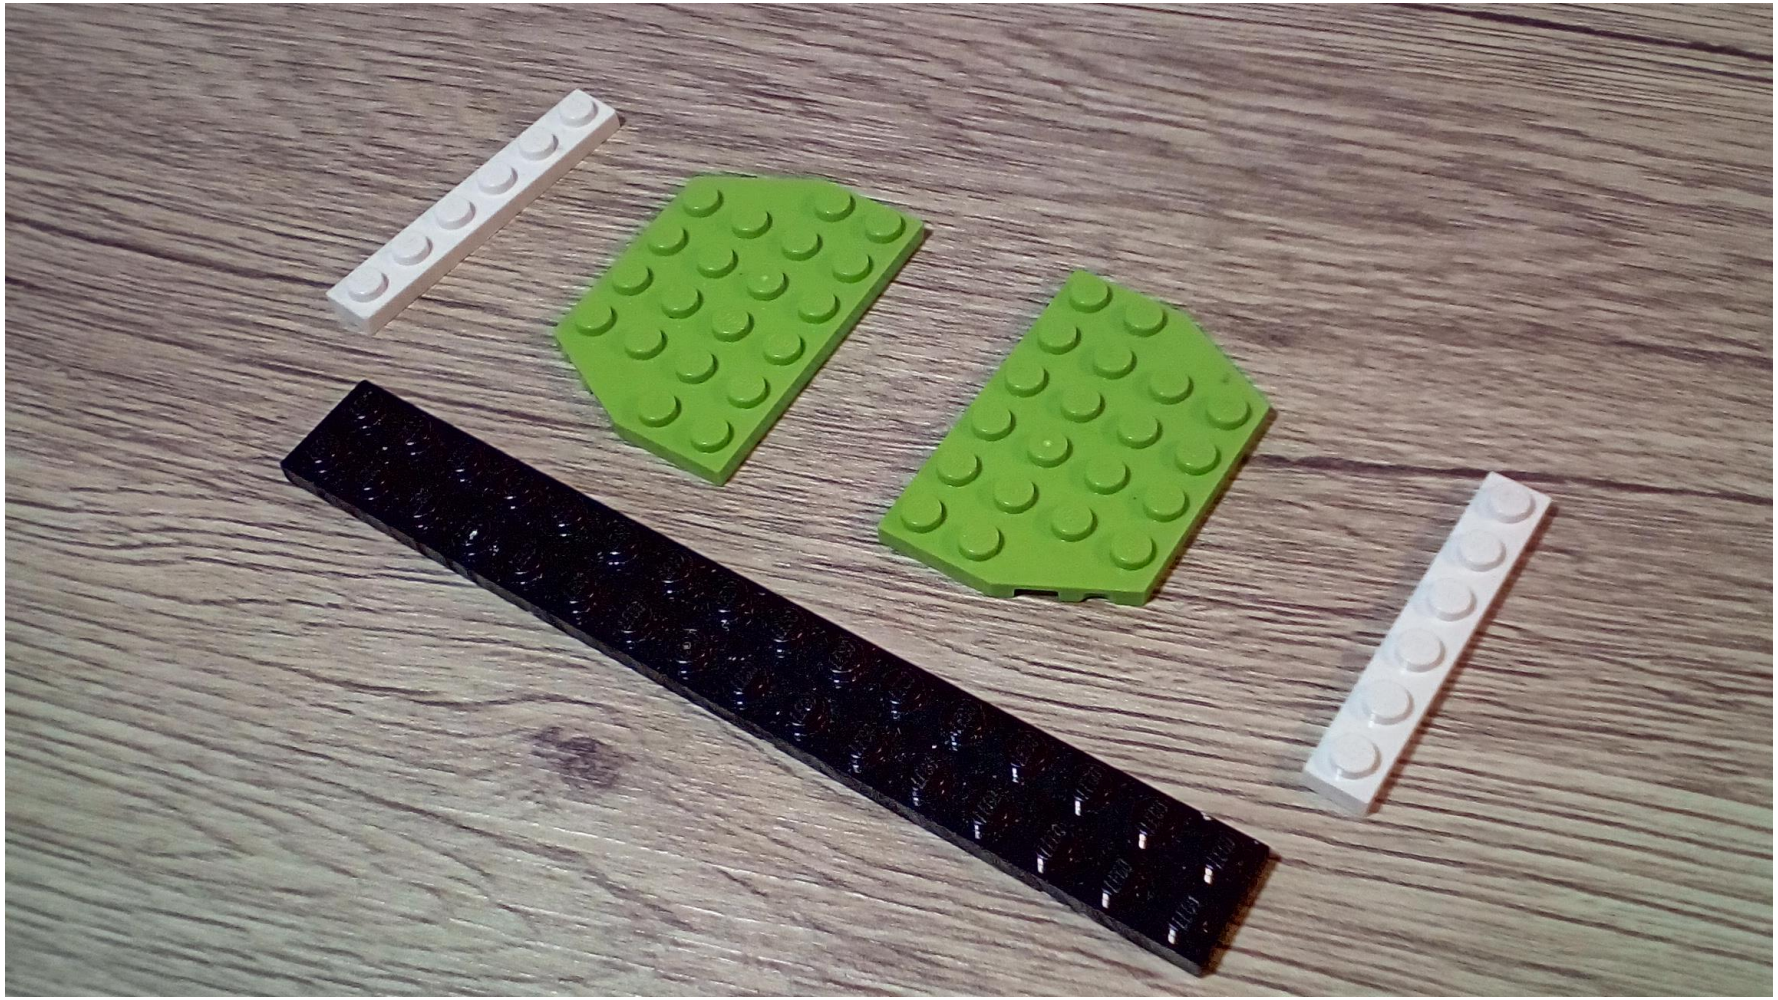

Yeah! We can build an airplane that rotates due to the air!
